62316	Expert Saucepan 16 cm	140 NIS

## TPB tech ELEVATION

All the TPB tech recipients include ELEVATION POINTS on its base of long-term durability. Suitable for ovens and dishwashers.

## REASONS FOR THE ELEVATION:

- Thanks to this elevation, the cookware does not wear while cooking nor do they leave a mark on the worktop. Also when food drips underneath the cookware, the food will not attach to the base and as a result this cookware and surface will always remain clean.
- The residual temperature on the surface remains very low due to the elevation of the cookware since it is not in direct contact with the surface. There are also **no strident noises** when moving the cookware on the surface and the **electrical consumption is very low**.
- TPB tech® has a residual temperature range between 80° to 150°. TPB tech® induction system therefore **saves around 50%** of energy compared to any other induction system on the market and cools down 70° faster (as a result of its special composition) and 95% faster if we clean the surface with a sufficient quantity of water.
- In 2019 the introduction of new energy regulations will require all induction systems to produce a maximum of 190 watts per hour (currently a standard induction system in glass uses 250 watts per hour) **TPB tech® is already achieving 172 watts per hour** thanks to our elevation pan system and the technical worktop composition
